

Packing instructions / Compatibility Test

'Protect' reserve chute used with Swing Connect harnesses

We would like to emphasise to pilots the importance of the **Compatibility Test**. You must test that the reserve chute can still be deployed whenever it is packed or repacked.

Caution: In the worst-case scenario, if the reserve has not been packed correctly, it may fail to deploy.

Important

1. Attach the Protect handle to the outer hangpoint.

2. Loops **must face upwards** (towards the seat). The deployment accelerator (little white chute) is placed at the rear in the direction of flight.

Final check: The connection lines between the handle and the inner container **must be long enough** that the pins can be released.

(The connection lines can then be put behind the flap again).

Enjoy yourself!
